

CT30A2910 Introduction to Web Programming Project

Weather Application – Balach Talpur 003182844

Introduction

I planned to make a simple weather application for my final project. It mainly uses the tools and information provided in the lectures. I divided the work in 3 parts and then further more divisions on those parts. First I created the base with no style HTML along with basic data displaying functions, this included searching for weather data sources. In the second stage that I worked on styling and how the data should be displayed. Also in the second stage I added comments to the code to make it more understandable, and searched for the pictures that I used. In the third stage I added the final features and tried to make the code more readable, and also added the final comments to the code. In the third stage I also worked on some display styling.

Tools Used

As I mentioned earlier the tools used were mostly taken from the lecture codes and weekly tasks. Wherever I felt the need for more HTML tags or css styles I used w3schools. I mainly used 3 data sources: Meteo Weather API, Open Weather Map API, and Weather API. Only Meteo API didn't require any registration or API key, the other 2 did. I have also commented in the code the validities of the API keys.

Points I expect to get from the Project

In all fairness I expect to get around 38-39 because I think I did a decent job according to what was taught in the lectures. I added all the features that were mention in the Project Description document. Along with that I added one more feature on my own, it is the wind speed switcher to switch from km/h to mph. I tried to make the best project I could according to the knowledge I gained in the course.

I would also like to add somethings about what I could have done better. I could have added more design, also I could have added more validation. At last I think I could have made it more organised and well documented.

AI Usage

I used 1 AI system:

Claude

I used claude to help me find the bugs in the code when something wasn't working the way I intended. Also I used it understand the errors that I got in the browser console. Along with that I used to understand the data structure of the data received from an API

because it was a lot of data and I was not trained enough to read properly. I also used it to understand the differences between different data sources and APIs.

References, Images and Links

I used the website iStock to get the 3 pictures used for the page background.
